2½" Movable Shutter Plan
Hidden Control Arm

Project Name: 250-moveable-hidden

Shutter Description: i.e. West Window

Thank you for using Rockler's Shutter Design Wizard. Please review the following information before building your shutters. The Shutter Design Wizard allows you to save plans individually, email them to yourself or your builder, or print them out for use in your shop. Plus, you can reset the Shutter Design Wizard to configure additional shutter panel sizes as needed for your entire project.

Important Notes:

- Consult the Shutter Measuring and Mounting Guide to determine accurate shutter panel dimensions.
- The program assumes 5/4 stock (1 1/16" finished thickness) for all frame pieces (stiles and rails). Minimum thickness for all Shutter Stile Jigs is 1".
- The program uses preset values for stile and rail widths. Stiles are a standard 2" wide. Top and bottom rails adjust according to panel height.
- Plans default to dowels for the frame joinery. If using mortise and tenon joinery for the frame, add tenon length to the rails.
- For shutters over 48" in height, a middle rail is recommended. See the Shutter Measuring and Mounting Guide for details.
- When drilling basswood, drill slowly and allow the bit to clear the chips. Basswood is a stringy hardwood and if you drill too fast, the shavings will bind up in the self-centering bit.
- Movable louvers use one shutter pin on each end to connect the louver to the stiles. Do not glue the plastic pins in the louver or in the stile.
- Movable pins have a 1/32" shoulder to provide rotation clearance.
- Six tension pins are included in every package of 50 shutter pins. Add two or more per shutter panel to provide louver resistance.
- Shutter plan does not include additional stile width required for the overlap between adjoining shutters. Consult the Shutter Measuring and Mounting Guide for more information on multiple shutter configurations.
